

## **ABSTRACT**

A secure Voice-Over-IP (VOIP), video and data network functionality in a single, small size deployable case, for a remote user. While capable of secure communications, the disclosed system also provides communication capability (VOIP, video and/or data) in a non-secure manner if desired. Most importantly, bulk encrypted (i.e., secure) data may be routed over a public network, e.g., the Internet.
